

Cumberland Risk Partners

Orpheion AI Risk Desk | September 2026 | Demonstration only

Fictional scenario. Cumberland Risk Partners and Henderson Accounting LLC are invented organizations. Every operational finding and client fact in this sample is simulated. This is a demonstration of the deliverable, not an assessment of a real agency or a record of completed remediation.

What needs a decision

The assumed agency has 24 staff and a 65% commercial book. Two workflows require immediate control decisions: confidential client material entered into an unapproved tool, and AI-assisted coverage summaries without a recorded source-check standard.

Review scope	Illustrative status
6 tools / 7 workflows	2 high-priority workflows; 3 moderate; 2 lower priority
Tool decisions	2 approved; 2 provisional; 2 unapproved
Evidence quality	Questionnaire and workflow descriptions only; settings and policy documents not independently tested
Incident status	No incidents reported in the fictional questionnaire; absence of an incident is not verified

Three owner decisions

Decision	Owner / target	Evidence needed to close
Suspend confidential uploads to T3 pending review.	Agency principal / day 1	Staff notice and acknowledgement; tool/data rule recorded
Require licensed review against source forms before coverage summaries leave the agency.	Commercial lead / day 3	Completed review log tied to source forms and approved final version
Assign responsibility for meeting-recording settings and consent process.	Operations lead / day 7	Retention settings, access list and approved recording procedure

Producer opportunity: Henderson Accounting has a fictional December 1 renewal. The attached client snapshot provides a reason for a focused AI-use discussion now. It does not conclude that insurance will or will not respond.

Review priority reflects data sensitivity, output consequences and missing controls. No numerical loss probability, compliance score or errors and omissions reduction is claimed.

Controls that can be checked

Cumberland Risk Partners | Fictional inventory and action evidence

Tool / workflow	Status / priority	Required control
T1 Marketing assistant: public social-post drafts	Approved / Lower	Human publication review; public information only
T2 Enterprise assistant: internal meeting summary	Provisional / Moderate	Review access, data scope and retention before expansion
T3 Personal chatbot: public prospect research	Unapproved / Moderate	Move to an approved account and define permitted inputs
T3 Personal chatbot: client-document summary	Unapproved / High	Suspend confidential uploads; assess prior data handling
T4 Policy assistant: coverage summary	Provisional / High	Licensed reviewer checks source forms; log discrepancies
T5 Client-call transcriber: call notes	Unapproved / Moderate	Vendor, consent, sharing and deletion review
T6 Writing assistant: generic grammar edits	Approved / Lower	No client data; staff check final wording

Minimum approval record

For each use: tool/account owner, business purpose, permitted data, prohibited data, access permissions, retention and training-use terms, human reviewer, decision date and next review. A tool can be acceptable for public marketing and unacceptable for client records; approval attaches to the use case.

A review log that creates useful evidence

Record workflow ID, source document/version, generated draft/version, discrepancies found, corrections, reviewer name/role, approval time and delivery destination. A checkbox saying “reviewed” is insufficient if it cannot be tied to the actual source and output.

Monthly change review

Review the six-tool register and agreed source notices monthly. Record the dated change, affected workflow, evidence and owner decision. If the review finds no material change, say “no material change found within the reviewed sources,” and preserve the sources checked. Urgent incidents go to the agency’s existing incident-response process.

Illustrative priorities are service triage, not NIST ratings. The method draws on the NIST AI Risk Management Framework: govern responsibility, map context, measure evidence and manage actions. [NIST framework and generative-AI profile](#).

Henderson Accounting LLC

Prepared for the client by Cumberland Risk Partners | Fictional example

Purpose: make the next AI-use conversation specific. This snapshot organizes reported activities, questions and practical controls. It does not certify compliance, determine coverage or assess the quality of your professional advice.

What the client reports

An illustrative 18-person accounting firm reports using AI for marketing, drafting customer emails and preparing first drafts of advisory material. One employee has used a personal chatbot with excerpts from client documents. Professional advice is reviewed by a manager, but the review is not consistently recorded. Renewal date: December 1, 2026 (assumed).

AI activity	What could go wrong	Question to resolve
Marketing drafts	Inaccurate statements or content-rights issues	Who checks factual claims and permissions before publication?
Customer emails	Incorrect commitments or confidential content shared	Does a person approve every client email and its recipient?
Advisory first drafts	A plausible error reaches a client and affects a decision	Is each material statement checked against authoritative records?
Personal chatbot with client excerpts	Confidential information handled under unknown terms	What data was entered, into which account, and under which settings?

What is known versus unknown

Reported: activities above and informal manager review. **Not reviewed:** vendor contracts, account settings, access logs, client permissions, engagement letters, policy wording or endorsements. **Not established:** a data breach, a professional error, an uninsured loss or an applicable legal violation.

Evidence identifiers for this fictional exercise: H-Q1 owner questionnaire; H-W1 workflow description. Neither is a real client document. A live snapshot would include dated, authorized evidence and the identity of the reviewer.

A practical 30-day action plan

Henderson Accounting LLC | Fictional example | Keep with the renewal file

When / owner	Action	Completion evidence
Now / Managing partner	Pause confidential uploads into unapproved personal AI accounts while the use is reviewed.	Staff instruction; list of approved uses and account owners
Within 7 days / IT contact	Confirm vendor terms, sharing, retention, access and available privacy settings.	Dated settings review and documented approval decision
Within 14 days / Advisory lead	Require documented checks of material AI-assisted advice before client delivery.	A completed review log for one representative work product
Within 30 days / Operations	Train the team on permitted data, escalation and reporting unexpected output or disclosure.	Attendance record and simple reporting procedure

Discuss with your insurance adviser

Describe each AI use and the consequences if it fails. Ask your licensed adviser to review the actual professional-liability, cyber, general-liability and other relevant policy terms, including exclusions, endorsements, conditions and application questions. Ask whether there is an appropriate market option for the reported exposure. This is a discussion request, not a statement that a coverage gap exists.

Bring these items to the discussion

A list of AI tools and business purposes; types of information entered; who approves outputs; vendor/account controls; relevant client commitments; and current declarations, forms and endorsements requested by your producer. Share information through the agency's approved channel and avoid unnecessary personal or confidential data.

Next agreed checkpoint

Illustrative: the operations lead returns the tool list in seven days; the managing partner and producer review progress in 30 days. In a real engagement, the client and producer must confirm these dates and responsibilities.

Your decision remains yours. This brief identifies questions and proposed controls. Your management owns implementation, your licensed producer owns insurance advice, and your legal or security specialists address matters within their expertise.

Make the renewal discussion useful

Henderson Accounting LLC | Not for client distribution without review

Suggested opening

“Before renewal, I want to understand how AI is used in your business. We have a short review that separates public marketing uses from client-data and professional-work uses. Could we confirm which activities apply and what review happens before outputs reach your customers?”

Four questions to resolve

- 1. Which tools touch confidential customer information, and who approved them?
- 2. Which outputs affect advice, hiring, safety, money or customer commitments?
- 3. What evidence shows that a qualified person checks material outputs?
- 4. What changed since the last application, renewal or risk review?

One current market signal, used carefully

HSB announced small-business AI liability coverage on March 18, 2026, with rollout through partner carriers pending regulatory approval. That announcement supports asking about AI exposure. It does not confirm availability for this client, in this state, through this agency or under any specific policy.

Source: [HSB product announcement, March 18, 2026](#). Reviewed September 10, 2026. Current eligibility, distribution, forms and state availability must be verified before presenting options.

Producer approval before use

Check	Pass evidence
Facts	Client confirms use cases; unknowns remain clearly marked
Insurance statements	Licensed reviewer checks any policy-specific statement against the actual forms
Brand and delivery	Agency approves final wording, branding, recipient and delivery route
Follow-through	Record client questions, requested actions, responsible person and follow-up date

Measure usefulness, not activity alone

Did a client discussion occur? Did it reveal a previously undocumented use or resolve a material question? Did the producer use the brief with minimal rewriting? Record preparation and review time. A booked meeting is not proof of retention, additional commission or reduced errors and omissions risk.

In a live pilot the client materials are released only after agency approval. No policy interpretation, legal opinion, premium estimate or coverage promise is supplied by this sample.

Try the service on five clients

Orpheion AI Risk Desk | \$1,500 total / 60 days / no automatic renewal

The test: will completed client reviews and a practical agency action process be useful enough to buy and continue? The previous five pages show a fictional format. The price and scope on this page are the proposed commercial offer, not evidence of existing customers.

Included in the fixed price

One team of up to 25 staff; inventory of up to ten tools and ten workflows; an agency action brief and approved-use register draft; five client AI Exposure Snapshots and producer briefs; two scheduled monitoring reviews; kickoff, producer training and closeout; one correction round per deliverable.

How the 60 days work

Stage	Work and buyer participation
Days 1–10	Confirm scope and approved data channel; agency supplies tool/workflow facts; nominate five clients and a licensed reviewer.
Days 11–30	Prepare agency action brief and first two client snapshots after complete inputs; agency checks facts and approves use. First monitoring review.
Days 31–50	Complete three more snapshots and support the producer review process. Track client use and time spent.
Days 51–60	Second monitoring review and outcome discussion. Agency decides whether the service merits continuation.

Optional continuation: \$750/month

Monthly action/monitoring brief, maintained scoped register, two new or refreshed snapshots each month, quarterly control refresh and a 30-minute monthly review. Month-to-month; unused snapshots do not roll over. Additional scope is quoted separately.

What the agency supplies

An authorized sponsor, an operations owner, a licensed producer reviewer, complete questionnaires and permission to use the minimum necessary client information. Timing depends on agreed input dates. Legal opinions, coverage determinations, software deployment and incident response are outside scope.

Acceptance: agree scope and delivery readiness, then pay \$1,500 before kickoff. No start by the agreed date: full refund. Missing a core day-60 deliverable: ten-business-day cure, then full refund on request. Final terms belong in the accepted scope. Maximum initial cohort: five agencies.
